Information Categories

A -- Aid:
provide medical services, shelter, donations, loans, advice, encouragement, implement safety measures

B -- Building Damage:
structure itself plus windows and chimneys (typically damage visible from outside the building)

E -- Earthquake Description:
where, when, duration, direction, sound, motion, number and timing of aftershocks

G -- Geologic Effects:
changes at the Earth's surface, fault scarps, rockfalls, landslides, ground cracks, ground subsidence, sand boils, water spouts; effects on springs, lakes, wells

H -- Humor:

I -- Impact:
changes in daily routine; rumors; influx of reporters, politicians, cost in dollars

L -- Lifelines:
effects on transportation: roads, bridges, railroads, airports
effects on communications: telephone, telegraph
effects on power, gas, water, and sewer lines
effects on dams

N -- Nonstructural Effects:
effects on plaster, furnishings (typically damage or rearrangement of furnishings visible inside a building)

P -- People:
effects on and responses to, during and after; deaths, injuries, near misses

R -- Recovery:
clean up, rebuild

S -- Scientific:
exploration of the day

Back to Summary
In Roy Gulch, Montana, the earthquake shattered the ground overturning clods of earth. The clods are white because of a deposit of lime "calice" just beneath the soil. Photo by J.T. Pardee, U.S. Geological Survey.

[Back to Summary]
School in Three Forks, Montana. According to an article by Fred F. Willson published in the Bulletin of the Seismological Society in Sept. 1926, p. 168, "...this building was the usual type, with concrete foundation, brick walls laid in lime mortar, and with wooden floor joists and wooden rafters. The walls bulged to a certain extent on all four sides, plaster was badly cracked throughout, and the foundation and basement were also damaged."
